Explaining the FastAPI Project

A simple, confident way to describe the architecture in an interview

Your 35-second answer

I worked on a code-review platform with a FastAPI backend. A user sends a code change, or diff, to the API. The backend checks the request and passes the diff to a coordinator that runs specialist reviewers for code structure, code quality, and security, with an AI reviewer available for deeper analysis. It combines and sorts the findings, saves the review in a database, and sends a clear result back to the web app. I also worked with API areas for login, GitHub pull requests, and streaming AI chat.

How to explain what happens

1. The app sends a diff

The web page calls a FastAPI endpoint with the changed code.

2. FastAPI checks it

It validates the input and provides database/auth information to the endpoint.

3. Reviewers inspect it

Specialist tools check structure, quality, and security; an LLM can add context.

4. Results are organized

The backend combines findings, removes duplicates, and puts severe issues first.

5. The result is saved

SQLAlchemy stores the review and findings, then the API returns them as JSON.

Plain-English translations

Term	Simple meaning
FastAPI	The Python framework that receives web requests and returns responses.
API route	A URL for one operation, such as starting a review or fetching review history.
Dependency	Shared setup FastAPI supplies to a route, such as a database session or signed-in user.
Orchestrator	The coordinator that runs reviewers and combines their results.
SSE streaming	A way for AI chat text to arrive gradually instead of waiting for the full answer.

If they ask what you learned

“I learned how to keep a backend organized: the API handles requests, focused components do the review work, and the database stores the results. That makes each part easier to understand and improve.”

Tip: keep the answer focused on the user journey. If the recruiter wants more detail, explain one piece next: the review agents, database, authentication, or AI streaming.
